(54) **Airbag**

(57) An airbag is provided which is easy to be sewn up and which is capable of providing a large extent of thickness when inflated comprises two pieces of panels (A,B). The panels (A,B) are superposed on each other and sewn by a seam along sides (1,2,3,11,12,13) so as to make an envelope. Sides (4a,4b) are sewn by a seam (30). Other open edges than the sewn edges of the envelope are sequentially sewn by seams (40,50,60).

EP 0 955 215 A2

Description

BACKGROUND OF THE INVENTION AND RELATED ART STATEMENT

[0001] The present invention relates to an airbag of an airbag apparatus which is installed in a vehicle including an automobile and, more particularly, relates to an airbag which is preferable for a passenger's seat.

[0002] A conventional airbag having a drum shape for a front passenger's seat consists of three panels. Another airbag consisting of two panels is also known.

[0003] The former comprises three panels which are a pair of end panels and one drum panel. The end panels constitute portions corresponding to both drum head-ends of a drum shape and the drum panel constitutes a portion corresponding to a body-shell of the drum shape. Although this airbag provides a large extent of thickness (the length along a direction from a vehicle occupant to an instrument panel) when inflated, it takes long time to sew up the airbag because it is sewn in three dimensions.

[0004] On the other hand, the airbag comprising two panels which are sewn to each other along their peripheries can be easily sewn because it is sewn in two dimensions, but provides a less extent of airbag thickness when inflated.

OBJECT AND SUMMARY OF THE INVENTION

[0005] It is an object of the present invention to provide an airbag which can be easily sewn and is capable of providing a large extent of thickness when inflated.

[0006] An airbag of a first aspect of the present invention comprises two schematically trapezoidal panels A and B which are sewn together. The panel A includes a side 2 corresponding to a top of a trapezoid, a side 4 corresponding to the base of the trapezoid, and sides 1 and 3 corresponding to the oblique sides of the trapezoid, and has a rectangular recess 5 formed in the middle of the side 4 and protrusions 6a, 6b protruding from portions of the sides 1, 3 near the side 4. The panel B includes a side 12 corresponding to the top of the trapezoid, a side 14 corresponding to the base of the trapezoid, and sides 11, 13 corresponding to the oblique sides of the trapezoid, and a rectangular protrusion 15 protruding from the middle of the side 14. The protrusions 6a, 6b have lateral sides 7a, 7b continuously connected to the sides 1, 3. The side 4 of the panel A has sides 4a, 4b on both sides of the rectangular recess 5. The rectangular recess 5 has sides 51, 53 continuously connected to the sides 4a, 4b, and a side 52 connecting the sides 51 and 53. The side 14 of the panel B has sides 14a, 14b between the both lateral sides 15a, 15b of the protrusion 15 and the sides 11, 13, respectively. The panels A, B are sewn together along the sides 1, 11, along the sides 2, 12, and along the sides 3, 13 by a seam 20. Portions along the sides 4a, 4b of the panel A

are sewn to each other by a seam 30 and edges of the protrusions 6a, 6b of the panel A and an edge of the protrusion 15 of the panel B are sewn to each other by a seam 40. Portions along the side 7a of the panel A and the side 15a and a portion along the side 14a of the panel B are sewn to each other by a seam 50 and portions along the side 7b of the panel A and the side 15b and a portion along the side 14b of the panel B are sewn to each other by a seam 50. Portions along the sides 51, 53 and a portion along the side 52 of the rectangular recess 5 of the panel A are sewn to each other by a seam 60.

[0007] The following process can be taken as an example to sew up the airbag of the first aspect.

[0008] The panels A, B are superposed on each other and then sewn together along the sides 1, 2, 3, 11, 12, and 13 by the seam 20 so as to make an envelope body. The envelope body is reversed inside out. The sides 4a, 4b of the panel A are superposed on each other and portions along the sides 4a, 4b of the panel A are sewn to each other by the seam 30. The protrusions 6a, 6b of the panel A are superposed on the protrusion 15 of the panel B and are sewn up by the seam 40. After the sides 7a, 15a are straightened, they are superposed on the side 14a of the panel B and sewn by the seam 50. After the sides 7b, 15b are straightened, they are superposed on the side 14b of the panel B and sewn by the seam 50. The sides 51, 53 of the rectangular recess 5 of the panel A are straightened and they are superposed on the side 52 and sewn by the seam 60. It should be noted that the aforementioned sewing process is just an example and modifications can be taken. The envelope body may not be reversed inside out.

[0009] An airbag of a second aspect of the present invention comprises two schematically trapezoidal panels A' and B which are sewn together. The panel A' includes a side 2 corresponding to a top of a trapezoid, a side 4 corresponding to the base of the trapezoid, and sides 1 and 3 corresponding to the oblique sides of the trapezoid, and has a rectangular recess 5 formed in the middle of the side 4. The panel B includes a side 12 corresponding to the top of the trapezoid, a side 14 corresponding to the base of the trapezoid, and sides 11, 13 corresponding to the oblique sides of the trapezoid, and a rectangular protrusion 15 protruding from the middle of the side 14. The protrusion 15 has sides 15a, 15b continuously connected to the side 14 and a side 15c connecting the sides 15a and 15b. The side 1 of the panel A' consists of a side 1f superposed on the side 11 of the panel B and a side 1r lengthened from the side 1f. The side 3 of the panel A' consists of a side 3f superposed on the side 13 of the panel B and a side 3r lengthened from the side 3f. The side 4 of the panel A' has sides 4a, 4b on both sides of the rectangular recess 5. The rectangular recess 5 has sides 51, 53 continuously connected to the sides 4a, 4b, and a side 52 connecting the sides 51 and 53. The side 14 of the panel B has sides 14a, 14b between the both lateral sides 15a, 15b

of the protrusion 15 and the sides 11, 13, respectively. The panels A', B are sewn together along the sides 1f, 11, along the sides 2, 12, and along the sides 3f, 13 by a seam 20. Portions along the sides 4a, 4b of the panel A' are sewn to each other by a seam 30 and a portion along the side 15a of the panel A' and a portion along the side 14a of the panel B are sewn to each other by a seam 58. A portion along the side 15b of the panel A' and a portion along the side 14b of the panel B are sewn to each other by a seam 58 and portions along the sides 1r, 3r of the panel A' and a portion along the side 15c of the panel B are sewn to each other by a seam 48. Portions along the sides 51, 53 and a portion along the side 52 of the rectangular recess 5 of the panel A' are sewn to each other by a seam 60.

[0010] The following process can be taken as an example to sew up the airbag of the second aspect.

[0011] The panels A', B are superposed on each other and then sewn together along the sides 1f, 2, 3f, 11, 12, and 13 by the seam 20 so as to make an envelope body. The sides 4a, 4b of the panel A' are superposed on each other and portions along the sides 4a, 4b of the panel A' are sewn to each other by the seam 30. The sides 1r, 3r of the panel A' are superposed on the side 15c of the protrusion 15 of the panel B and are sewn up by the seam 48. The sides 14a and 15a of the panel B are superposed on each other and are sewn up by the seam 58. The sides 14b and 15b of the panel B are superposed on each other and sewn up by the seam 58. The sides 51, 53 of the rectangular recess 5 of the panel A' are straightened and they are superposed on the side 52 and sewn by the seam 60. It should be noted that the aforementioned sewing process is just an example and modifications can be taken.

BRIEF DESCRIPTION OF THE DRAWINGS

[0012]

Figs. 1a through 1f are views illustrating a process of sewing an airbag according to a first embodiment;

Figs. 2a through 2f are views illustrating the process of sewing the airbag according to the first embodiment;

Fig. 3 is a view illustrating the process of sewing the airbag according to the first embodiment;

Fig. 4 is a view illustrating the process of sewing the airbag according to the first embodiment;

Fig. 5 is a view illustrating the process of sewing the airbag according to the first embodiment;

Fig. 6 is a view illustrating the process of sewing the airbag according to the first embodiment;

Figs. 7a through 7c are views illustrating the process of sewing the airbag according to the first embodiment;

Figs. 8a and 8b are views illustrating the process of sewing the airbag according to the first embodi-

ment;

Fig. 16 is a view illustrating the process of sewing the airbag according to the second embodiment;

Figs. 17a and 17b are views illustrating the process of sewing the airbag according to the second embodiment;

Fig. 18 is a perspective view of the sewn airbag according to the second embodiment; and

Fig. 19 is a perspective view of a sewn airbag according to the second embodiment.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

[0013] Hereinafter, embodiments of an airbag of the first aspect of the present invention will be described with reference to Figs. 1 through 10.

[0014] Two panels A and B are cut out of a foundation cloth. The panels A and B are superposed on each other, as shown in Figs. 1a and 1b. The panel A is formed in a schematically trapezoidal configuration having four sides 1, 2, 3, and 4. The side 4 corresponding to the base of the trapezoid is formed in a V-like configuration and is provided with a rectangular recess 5 in the middle thereof. The side 4 of the panel A includes sides 4a, 4b on both sides of the rectangular recess 5. The rectangular recess 5 includes sides 51, 53 continuously connected to the sides 4a, 4b and also includes a side 52 connecting the sides 51, 53.

[0015] As for the sides 1, 3 corresponding to the oblique sides of the trapezoid, protrusions 6a, 6b protrude from portions of the sides 1, 3 near the side 4, respectively. Numerals 7a, 7b designate lateral sides of these protrusions 6a, 6b. These sides 7a, 7b continuously connected to the sides 1, 3. The side 2 is positioned to correspond to the top of the trapezoid.

[0016] The panel A is provided with a gas inlet 9 formed therein.

[0017] The panel B is formed in a schematically trapezoidal configuration having four sides 11, 12, 13, and 14. The side 14 corresponding to the base of the trapezoid includes a protrusion 15 protruding therefrom. Numerals 15a, 15b designate lateral sides continuously connected to the side 14 of the protrusion 15. A side

protrusion 15 is also folded in two so that the sides 15a, 15b are superposed on each other and the sides 14a, 14b are also superposed on each other. In this state, portions along the sides 4a, 4b of the panel A' are sewn to each other as shown in Fig. 12b and Fig. 14. A numeral 30 designates a seam along the sides 4a, 4b. Figs. 12c and 12d are sectional views taken along a line C-C and a view taken along a line D-D, respectively.

[0038] As shown in Fig. 12c, a sewn portion 21 by the seam 20 is disposed outside the sewn body.

[0039] After that, the panels A', B of this sewn envelope body are pulled in the direction of arrows E, E in Fig. 12d. After the body becomes in a state shown in Fig. 12e, it is further pulled in the direction of arrows F, F in Fig. 12e so as to become in the state shown in Fig. 12f and Fig. 15. As a result thereof, the sides 1r and 3r become linear in a straight line.

[0040] Then the side 15c of the protrusion 15 is sewn to the sides 1r, 3r of the panel A' by the seam 48 and the sides 15a and 14a are sewn to each other, and the sides 15b and 14b are sewn to each other by the seam 58, respectively.

[0041] After that, the left and right corners 5L, 5R where the sides 51, 53 of the rectangular recess 5 intersect the side 52, respectively are pulled in the direction of arrows VIII_a, VIII_b in such a manner as the former embodiment as shown in Fig. 17a. Then, the panel A' is sewn along these sides 51, 52 and 53 as shown in Fig. 17b. The numeral 60 designates the seam of the sewing.

[0042] In this way, an airbag is completed as shown in Fig. 18.

[0043] Because this airbag comprises only two pieces of panels A', B, and each of the sewn portions can be finished by the straight stitches, sewing work is easy. This airbag provides a large extent of thickness when inflated, such as obviously shown in Fig. 18.

[0044] In stead of the inlet 9, a pair of parallel slits 9a, 9b may be provided as shown in Fig. 19. By inserting a rod-shaped inflator in these slits 9a, 9b, the airbag can be connected to the inflator.

[0045] While the sewing process of this embodiment mentioned above is an example of producing the airbag of the present invention, other sewing process than the above may be employed in the present invention.

[0046] The airbag of the present invention is not only easy to be sewn, but also capable of providing a large extent of thickness when inflated, as mentioned above.

Claims

1. An airbag comprising two schematically trapezoidal panels A and B which are sewn together:

said panel A including a side 2 corresponding to the top of the trapezoid, a side 4 corresponding to the base of the trapezoid, and sides 1 and 3 corresponding to the oblique sides of the

trapezoid, and having a rectangular recess 5 formed in the middle of the side 4 and protrusions 6a, 6b protruding from portions of the sides 1, 3 near the side 4;

said panel B including a side 12 corresponding to an upper side of the trapezoid, a side 14 corresponding to the base of the trapezoid, and sides 11, 13 corresponding to the oblique sides of the trapezoid, and having an protrusion 15 protruding from the middle of the side 14;

said protrusions 6a, 6b of said panel A having lateral sides 7a, 7b continuously connected to the sides 1, 3;

said side 4 of said panel A having sides 4a, 4b on both sides of the rectangular recess 5;

said rectangular recess 5 having sides 51, 53 continuously connected to said sides 4a, 4b, and a side 52 connecting said sides 51 and 53; said side 14 of said panel B having sides 14a, 14b between the both lateral sides 15a, 15b of the protrusion 15 and the sides 11, 13, respectively;

said panels A, B being sewn together along the sides 1, 11, along the sides 2, 12, and along the sides 3, 13 by a seam 20;

portions along the sides 4a, 4b, of said panel A being sewn to each other by a seam 30;

edges of the protrusions 6a, 6b of said panel A and an edge of the protrusion 15 of said panel B being sewn to each other by a seam 40;

portions along the side 7a of said panel A and the side 15a and a portion along the side 14a of said panel B being sewn to each other by a seam 50;

portions along the side 7b of said panel A and the side 15b and a portion along the side 14b of said panel B being sewn to each other by a seam 50; and

portions along the sides 51, 53 and a portion along the side 52 of the rectangular recess 5 of said panel A being sewn to each other by a seam 60.

2. An airbag comprising two schematically trapezoidal panels A' and B which are sewn together:

said panel A' including a side 2 corresponding to the top of the trapezoid, a side 4 corresponding to the base of the trapezoid, and sides 1 and 3 corresponding to the oblique sides of the trapezoid, and having a rectangular recess 5 formed in the middle of the side 4;

said panel B including a side 12 corresponding to an upper side of the trapezoid, a side 14 corresponding to the base of the trapezoid, and sides 11, 13 corresponding to the oblique sides of the trapezoid, and having an protrusion 15 protruding from the middle of the side 14;
